Pred. No. is the number of results predicted by chance to have a

09/997(3) Page 1 Seg. (Ds 19765 Brannooh

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

WPI; 2002-172001/22. P-PSD8; AAU83611. One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for treating a PRO related disorder and for diagnosing tumors such as lung cancer, colon cancer, breast tumor, prostate tumor, rectal tumor or liver tumor.

Claim 2; Fig 39; 359pp; English.

The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polynucleotides encode hunan secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in pericyte cells, for stimulating the broliferation or differentiation of chondrocyte cells, for

```
for stimulating or inhibiting the proliferation of normal human dermal fibroblast cells. The PRO polypeptide may also be used as molecular weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABK33536-ABK33567 represent human PRO protein coding sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        211

The present invention relates to the isolation of novel human PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polymucleotides are useful for preparing a medicament useful in the diagnosis and treatment of tumours. Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. Acade41-Acade962 represent CDNA sequences encoding the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in sequence content of the sequence data for this patent was obtained in sequence uspection to remain directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for the manufacture of a medicament for diagnosing or treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GGGGACCTGTCTGAAGAGAAGATGCCCCCTGCTGACACTCTACCTGCTCCTCTTCTTCTGCCTC

```
The invention describes an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide
                                                                                                                                                                                                                                                                                            BP.

sequences having e.g. 4834, 2504 or 1759 bp fully defined in the specification, or the full length coding sequence of any these 122 nucleotide sequences. The FRO polypeptides or polymorlocitides are useful as pharmaceuticals, diagnostics, biosensors or polymorlocitides are useful as pharmaceuticals, diagnostics, biosensors or polymorlocities are useful as particularly useful for detecting tumours (e.g. lung tumour, colon in a mammal, for stimulating the trelease of TMP-alpha from human blood, for stimulating proliferation or differentiation of chondrocyte cells, for stimulating proliferation or differentiation of chondrocyte cells, for stimulating proliferation or differentiation of parityle carriage disorders (e.g. sports injuries or arthritis), or wounds. The polypeptide are useful for treating tumours or various bone and/or carriage disorders (e.g. sports injuries or arthritis), or wounds. The PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases, and in the diagnostic determination of the presence of these diseases. The PRO genes are useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective control of the control of th polypeptide

The invention describes one hundred and eighty seven nucleic acids encoding novel human secreted and transmembrane (PRO) polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating or diagnosing a cardiac hypertrophy, trauma, cancer, agetalated macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. This sequence encodes a novel human secreted and transmembrane PRO polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; secreted and transmembrane protein; PRO; cardiant; cytostatic; antiangiogenic; hypotensive; vulnenry; antiarteriosclerotic; gene therapy; cardiovascular disorder; andothelial disorder; angiogenic disorder; cardiac hypertrophy; tranma; cancer; age-related macular degeneration; atherosclerosis; hypertension; age-related microsis; hypertension; thrombophiebitis; lymphangitis; tumour angiogenesis; breast carcinom; thrombophiebitis; lymphangitis; tumour angiogenesis; breast carcinom; liver carcinoma; wound healing; chromosome mapping; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PJ;

The invention relates to a novel isolated nucleic acid encoding a fully defined PRO polypeptide. The molecules of the invention may be useful for stimulating proliferation or gene expression in pericyte cells or the release of TNF-alpha from human blood. Other possible uses include the stimulation or inhibition of chondrocyte proliferation or differentiation, the stimulation of human dermal fibroblast cell proliferation and the detection of the presence of a tumour within a mammal. Furthermore, the nucleic acid may be useful for the manufacture of a medicament for diagnosing or treating a tumour within a mammal or for measuring or detecting the expression of an associated gene, as well as during gene therapy. The current sequence is that of the human PRO CDNA of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       rcactoriggoringgangangangangnadages

The invention relates to a novel isolated PRO protein encoding nucleic acid. The mucleic acid of the invention may be useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence of a tumour in a mammal. Furthermore, the molecules of the invention may be useful for stimulating proliferation or gene expression in perioryte cells, the release of tumour necrosis factor (TNF)-alpha from human blood, the proliferation or differentiation of chondrooyte cells and for inhibiting the proliferation of normal human dermal fibroblast cells. Finally, the molecules may be utilised during gene therapy. The current sequence is that of the human PRO CDNA of the invention PRO; proliferation; gene; pericyte cell; TNF alpha; chondrocyte; blood; tumour necrosis factor; proliferation; differentiation; gene therapy; dermal fibroblast; ss. 1 ACCAGCAGAAGGCTGGGAGTCTGTAGTTTGTTCCTGCTGCTGCCAGGTCCACTGAGGGAAAC TCAGGCTACTCCATTGCCACTCAAATCACGGTCCAACAACAGTGAATGGCTTGGAGCGG 32 ACCAGCAGAAGGCTGGGAGTCTGTAGTTTGTTCCTGCTGCCAGGCTCCACTGAGGGAAC GGGGACCTGTCTGAAGAAGATGCCCCTGCTGACACTCTACCTGCTCCTTCTTCTGGCTC 61 GGGGACCTGTCTGAAGAGAAGATGCCCCTGCTGACACTCTACCTGCTCTTCTGGCTC PJ; Wood V Gaps ø οŧ New PRO protein encoding nucleic acid, useful for preparing PRO polypeptides and anti-PRO antibodies for detecting the presence tumor in a mammal. One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for the manufacture of a medicament for diagnosing or treating

Claim 2; Fig 39; 315pp; English.

This invention relates to one hundred and twenty two novel nucleic acids encoding human PRO membrane bound proteins or receptors. Extracellular proteins play important roles in the formation, differentiation and maintenance of multicellular organisms. The fate of many individual cells (for example proliferation, migration or differentiation) is typically governed by information received from other cells and the immediate of proverned by information is often transmitted by secreted convironment. The information is often transmitted by secreted convironment. The information is often transmitted by secreted convironment. These membrane bound grotors, survival factors, cyctoxic factors, differentiation factors, neuropeptides and hormones) which are received and interpreted by diverse cell receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of receptor convironment interpreted bound proteins and receptors may be of use as pharmaceutical and diagnostic agents, such as in the blocking of sequences of novel human membrane bound receptors and proteins, along with the cDNA sequences errording them. The novel proteins of the invention may have cytostatic activities through the stimulation of conductorytes. The nucleic acids of the invention may be useful for the expression of a tumour associated gene. The present sequence is the cDNA sequence and norman abount of the invention or the expression of a tumour associated gene. The present sequence is the cDNA sequence. sequence encoding a human PRO protein of the invention

The invention describes an isolated PRO (secreted and transmembrane)

Co polypeptide (I) PRO982, PRO1160, PRO1187 or PRO1329 polypeptide are

Co resful for stimulating the proliferation of or gene expression in

periotyce cells. PRO387, PRO219, PRO1182, PRO1180, PRO1180, polypeptide are useful

Coff stimulating the proliferation of differentiation of chondrocyte

cells. PRO387, PRO387, PRO1180, PRO1181, PRO1180, PRO1419, PRO1419,

CC REACHAING the Proliferation of normal human dermal fibroblasts cells.

CC RRO5930, PRO592, PRO7186, PRO1194, PRO1174, PRO1192, PRO4181,

CC RRO5931, PRO5925, PRO7184, PRO1194, PRO1174, PRO1918,

CC Inhibiting the proliferation of normal human dermal fibroblast cells.

CC Inhibiting the proliferation of normal human dermal fibroblast cells.

CC Inhibiting the proliferation of normal human dermal fibroblast cells.

CC Inhibiting the proliferation of normal human dermal fibroblast cells.

CC Inhibiting the presence of tumour in the mammal. The tumour is lung involves comparing the presence of tumour in the mammal. The tumour is lung involves comparing the presence of tumour in the mammal. The tumour is lung tumour. Dreast tumour, prosente tendour in Promour.

CC Servening useful for therapent and gene mapphing or gene therapy. (II) as useful cofferencing or the prosession of the comparing or the presence of tumour in the mammal.

WPI; 2003-657982/62. P-PSDB; ADB80636.

One hundred and twenty two nucleic acids encoding PRO polypeptides, useful in gene therapy, chromosome identification, tissue typing, or hybridization probes in chromosome and gene mapping.

2; Fig 39; 305pp; English Claim

The invention describes an isolated PRO (secreted and transmembrane)

CC polypeptide (I) PRO982, PRO1160, PRO1187 or PRO1492 polypeptide are useful for stimulating the pro116reation of or gene expression in useful for stimulating the pro1187 or or Affectantiation of chondrocyte cells. PRO357, PRO229, PRO1152, PRO1106 or PRO1419 polypeptide are useful for stimulating the pro1116ration or differentiation of chondrocyte cells. PRO311, PRO3137, PRO725, PRO1136, PRO1419, polypeptide

361 ACCATGGAGGATCTCATGAAACTGATGCTGACACTTACTGGTGTGGAATTGAGAAAACT

The invention describes an isolated PRO (secreted and transmembrane)

CD polypeptide (1). PRO982, PRO1160, PRO1187 or PRO3129 polypeptide are

Useful for stimulating the proliferation of a gene expression in

pericyte cells. PRO982, PRO126, PRO1420 or PRO4405 polypeptide are useful

for stimulating the proliferation of differentiation of chondrocyte

cells. PRO031, PRO185, PRO1155, PRO1155, PRO1106, PRO1419, PRO1419,

Novel human secreted and transmembrane protein PRO10111 cDNA

secreted and transmembrane protein; PRO; gene; ss; cytostatic; vulnerary, antiarthritis, perioque cell proliferation; perioque cell proliferation; perioque cell proliferation; chondrocyte cell differentiation, chondrocyte cell differentiation, tumour necrosis factor alpha (TNF) alpha release, dermal fibroblast cell proliferation; dermal fibroblast cell differentiation inhibitor; tumour, lung colon tumour; breast tumour; prostate tumour; rectal tumour; liver tumour; tissue typing; chromosome mapping; gene mapping; Godowski PJ; `` rK, Wood Gerritsen ME, Goddard A, Godowski PJ Smith V, Stephan JF, Watanabe CK, for tissue typing, gene therapy, electrophoresis, and for treating

The invention describes an isolated PRO (secreted and transmembrane) by/yeeptide (I). PRO982. PRO186. PRO18187 or PRO1329 polypeptide are useful for stimulating the proliferation of or gene expression in pericyte cells. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are useful for stimulating the proliferation or differentiation of chondrocyte cells. PRO331, PRO357, PRO155, PRO1155, PRO1155, PRO11519 polypeptide are useful for stimulating the release of tumour necrosis factor (TNF)-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the PRO polymuclectides encoding them.

The PRO polypeptides and polymuclectides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. They are particularly useful for proster tumour, biomour, present tumour, present tumour
                                    New PRO polypeptides and nucleic acids encoding the polypeptides, useful e.g. in gene therapy, disease diagnosis, chromosome identification and tissue typing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WI,

Homo sapiens gene therapy

```
The invention describes an isolated PRO (secreted and transmembrane)

Colypeptide (I) PRO982, PRO1160, PRO1187 or PRO1339 polypeptide are

useful for stimulating the proliferation of or gene expression in

perioryte cells. PRO357, PRO229, PRO1272 or PRO4405 polypeptide are useful

Cor stimulating the proliferation of differentiation of chondrocyte

cells. PRO357, PRO357, PRO1306 or PRO1419 polypeptide

are useful for stimulating the release of tumour necrosis factor (INF)-

are useful for stimulating the release of tumour necrosis factor (INF)-
